

[August 2021](#) [Home](#) [Getting Started](#) [Resources](#) [Videos](#)

As the summer blazes on, our forests continue to grow and flowers bloom. Read on to learn more about the history of scientific forestry in the US, brown-eyed susans, and more! This month's Tree Talk features sugar maple, a favorite and sweet member of the *Acer* genus.

Top Stories

Heart(wood) of it All

This history of the lumber industry and scientific forestry in the United States is a fascinating one, complete with log jams, mansions, and forest festivals. The Cradle of Forestry, located just outside of Asheville, North Carolina, documents its beginning in a small school house on the Biltmore Estate.

Tree Talk: Sugar Maple

The month's Tree Talk features *Betula papyrifera* or white birch. An iconic species of New England, the Great Lakes states, and Canada, white birch (also called paper birch or canoe birch) is treasured for its distinctive bark. White birch is short-lived and highly dependent on disturbance for regeneration. Watch this month's video to learn more about this important pioneer species!

Trivia

July Trivia Reveal (pictured on the left)

The common hackberry (*Celtis occidentalis*) is a native shade tree to the Chesapeake Bay watershed and is commonly known as sugarberry or nettletree. Hackberry is easily identified by its gray-brown bark with distinct raised corky ridges and warts. On average, this resilient, fast-growing tree grows 40' – 60' tall, prefers full sun or partial sun and thrives in a variety of soil types. It can be found along rivers, streams, woodlands, rocky hillsides, limestone bluffs and in urban areas.

Hackberry is often used in urban plantings and in landscaping because of its wide soil adaptability, resiliency to tough conditions and beauty during all four seasons. It grows well in urban areas because of its high tolerance to drought, flooding, wind, salt, heat, pollution and compaction. Hackberry is also deep-rooted, meaning it is less likely to uplift sidewalks if planted correctly.

Wildlife, birds and pollinators also benefit greatly from the hackberry. The small, dark purple berries ripen in the fall and persist into the winter making them a great food source for wildlife into the colder months when food is less available. Hackberry also serves as a larval host for the American snout, Tawny Emperor, Hackberry Emperor and Mourning Cloak butterflies.
